A central collage of symbols: a glowing yin-yang, a sword with a bright blade, a clock with flames, and a globe.

MEEK GODMANSEED

Table of Contents

First Chapter – “The Science of God”

• The Sun	Pg.1
• The Earth	Pg.2
• Man, Animals, Bugs, and Plants	Pg.3
• DNA	Pg.4
• Molecules	Pg.6
• $E = MC$ squared	Pg.7

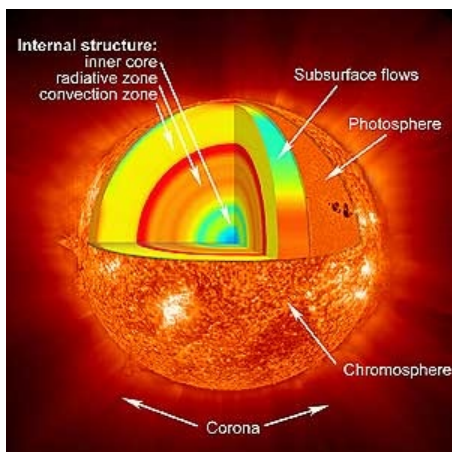

Second Chapter – “The History of God”

• The beginning of Man and Religion	Pg.8
• Ancient Egyptians	Pg.9
• The Naga	Pg.10
• The concept of Yin and Yang challenged!	Pg.11
• Buddhism	Pg.12
• The most popular of African Monotheistic beliefs	Pg.13
• The Biblical account of the Flood	Pg.15
• The truth about Dinosaurs	Pg.16
• Geologic Columns	Pg.17
• Carbon dating/Decay rates challenged!	Pg.18
• The Behemoth, the Leviathan, and the Dragon	Pg.19
• The Story of Exodus: True or False	Pg.20
• Imhotep and Joseph	Pg.24
• Why are there no records of Israelites in Egypt?	Pg.25
• Why didn't the Egyptians write about the Plagues?	Pg.27
• The Holy Bible	Pg.29
• What is Sin	Pg.33
• Are we really born in Sin?	Pg.33
• Did Jews and Muslims worship the same God?	Pg.34
• “Ancient Muslims” and current day Muslims	Pg.35
• More proof the Jews and Muslims worshiped the same God	Pg.36

- Was Muhammad greater than Jesus Christ?Pg.37
- Why did people follow Muhammad?Pg.37
- What is the Gospel really about?Pg.38
- What is “Spiritual Death”Pg.38
- So what does God want me to do?Pg.42
- Is Jesus God? Where in the Bible is Jesus called God?Pg.42

It has come to my attention that there are many people who are trying to find proof as to whether God exists or not, but don't know where to start. Well here are the reasons I believe what I believe. Evidence of intelligent design is all around us. Using **science** (a concept given to man by God to help man understand the wonder of intelligent design) we can easily discover the fingerprints of a humble giant on everything around us. For example:

• The Sun

If you're into astronomy (the study of space, stars, planets and things of that sort) then you would know that the Sun is a star; a ball of burning gas over 300,000 times the size of the Earth millions of miles away from the Earth. You should also know that Earth along with 8 other planets

Sun Statistics

Mass (kg)	1.989e+30
Mass (Earth = 1)	332,830
Equatorial radius (km)	695,000
Equatorial radius (Earth = 1)	108.97
Mean density (gm/cm³)	1.410
Rotational period (days)	25-36*
Escape velocity (km/sec)	618.02
Luminosity (ergs/sec)	3.827e33
Magnitude (Vo)	-26.8
Mean surface temperature	6,000°C
Age (billion years)	4.5
Principal chemistry	
Hydrogen	92.1%
Helium	7.8%
Oxygen	0.061%
Carbon	0.030%
Nitrogen	0.0084%
Neon	0.0076%
Iron	0.0037%
Silicon	0.0031%
Magnesium	0.0024%
Sulfur	0.0015%
All others	0.0015%

(Mercury, Venus, Mars, Jupiter, Saturn, Uranus, Neptune, and Pluto) are caught in the Sun's gravitational pull that causes the planets to rotate around the Sun in a systematic

order called the solar system. The Sun is undeniable evidence of intelligent design. First lets start with the orangey-yellow light (I say fire) and heat produced by the Sun. It is the only star that gives off this kind of light. Our sun hits just the right colors in the color spectrum to give off the right light needed to create photosynthesis so that Earth can support life.

Earth just happens to be in the exact right spot (not too far from or close to the Sun) in our solar system to support life. Were talking about a one in a billionth chance, a freak of nature, the impossible, or clearly intelligent design. That's right. "There are no other planets that can support life in the universe!" Many people believe that if Earth has life then other planets can too, but on the contrary this is an uneducated guess that is frequently concluded. Whether you believe in God or not most educated astronomers do not believe in Aliens. Our sun is the only one of its kind in the universe (trust me, people are still looking for a sun like ours). Even though it may not be the biggest sun in the universe it's definitely the most important (well to me anyway). The Sun is very unstable with its solar flares that extend to our planet to cause heat waves, and non stop global wild fire. The Sun could and should have gone out by now. Yep, I said it. The Sun should have either gone super nova (exploding or imploding and transforming into a black whole) or simply died out (lost its flame) thousands of years ago. Let's face it, the energy (fire) from the sun needs oxygen and a fuel source to stay lit and will rapidly consume the oxygen and the fuel source until they are gone. Okay, lets see now; there is no oxygen in outer space so how does the Sun (or any star for that matter) stay lit? According to scientific minds the Sun's gasses (hydrogen, a highly volatile substance, and Helium) has its own oxygen, according to the chart above 0.061% of the stars oxygen is mixed in with the gasses. Well that explains that right? Wrong. Gas burns very quickly especially hydrogen, and the Sun's energy (fire) already consumes its fuel at very high rates, so the Sun should have devoured itself by now. Oh and yes, I know the Sun is very big, but when you compare the ratio of the Sun to other suns and stars it should have already burnt out, or exploded by now. Even a small ball of hydrogen the size of your hand will burn up just as quickly as a 2 ton ball of hydrogen [which one weighs more a ton of hydrogen or a ton of feathers?]. If the Sun has not burnt out yet it is because a higher intelligence (God) is keeping it lit.

● The Earth

The Earth is full of marvelous wonders that point toward intelligent design. It is mostly water, about 70-75%.

Oh, and might I add that there is no water in space and yet the Earth is pretty much made of it (the only planet like it in the universe as far as we know), and if there is no water in space then why do we have comets (a combo of rock and ice).

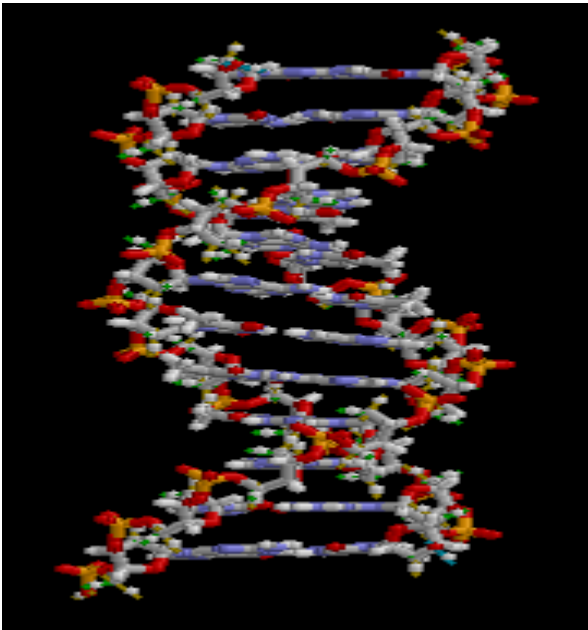

The fact that Space, can have ice without water or any other type of moisture is a sign of intelligent design. Everything on our planet requires water to survive. Some people believe that we evolved from the water and that all life on the planet comes from a single celled organism. Sorry folks, but when you really study the **Theory** of evolution you find no fact in it whatsoever because it's a **theory**. There are too many missing links, and besides, common sense tells us that if that were true there would still be evidence of it. Something would still be evolving. Evolution wouldn't just stop all of a sudden and then hide evidence of its existence, **not even in the past**. This is why when Darwin first tried to publish his book he was laughed at and his book failed (It really takes a lot more faith to believe in evolution than it does to believe in God). Water is amazing. In water we find an untapped energy source almost like the sun. Water is made up of 2 parts hydrogen and 1 part oxygen; when separated as you know hydrogen is very explosive but when recombined with oxygen a new gas called hho is formed. This gas is much more stable than just hydrogen by itself but we are still working on inexpensive and safe ways to separate and recombine them. The Earth's water contains enough hydrogen to set the planet ablaze like the sun, but when combined with oxygen to form H₂O; it is inflammable (Isn't it amazing how both the Earth and the Sun are full of hydrogen but have opposite effects on their entities, because without that ball of fire our ball of water would die). Water itself is evidence of intelligent design but the real miracle comes from knowing the amount of water compared to land on the planet. When you study a map of the globe you will notice that all of the continents fit together to form one piece of land that makes up about 30-35% of the Earth's surface. There is more than enough water to flood the Earth and there is no reason why it is not flooded now. Some water remains frozen (icebergs and ice lands like Alaska), and some stays in the sky (clouds). This is the only reason why the Earth is not covered in tons of water. No one knows why just the right amount of water stays liquid, solid, and gas but all signs point to either a highly improbable reoccurring freak of nature, or an exact system operating in periodical order according to a specific design that could have only been set into motion by a higher intelligence.

- Man, Animals, Bugs, and Plants

Humans, animals, bugs, and Plants are evidence of intelligent design. Unlike more intelligent organisms (humans and animals) bugs and plants are not born ignorant to life on this planet. When humans are born we are born ignorant. We are born with no knowledge of life, love, right, or wrong. The same can also be said about many animals. In fact the higher the intelligence of that creature the more its offspring will need parental guidance to explain right from wrong. Bugs and flowers do not come into the world ignorant of what's right, wrong, or how to survive. From birth or seedling, bugs and plants know what there purpose is on this planet and how to survive. When a spider spins its web the design pattern that forms the web was imprinted into the spider before it was hatched. No other spider has to teach other spiders how to hunt or spin webs, or eat. The same goes for other bugs such as Ants, Bees, and Termites. Ants, Bees, and Termites are very systematic and complex. Termites, Bees and Ants have Queens, workers, soldiers, and maids (in home care) that all work and live together in a huge collective that started from a single termite, ant or bee. Ants and termites even grow crops.

They herd other insects and milk them for sweet goods just like we herd cattle and milk them for dairy goods. They have graveyards for there dead, and yet when they are born no one has to teach them how to do there jobs, they already know. Procedure and protocol for survival comes from experiences learned under the law of adaptation and is then imprinted in there DNA according to evolution. First let's clear up the mistake we make about adaptation. Adaptation unlike evolution is a fact and does not prove or disprove evolution, nor does it prove or disprove intelligent design. To adapt to ones environment and to evolve are two different things. Evolution is when a bio-organism breaks through its original programming and design to become a new species. Example: monkeys that decided not to swing from trees anymore lost there tales, started to stand up right, and their brains grew far beyond the tree swingers. That belief is a theory because there is no proof. Adaptation is a fact with plenty of proof. Adaptation is when a bio-organism (creature) uses what it already has to survive in its current surroundings (environment). For example: "some hares (rabbits, bunnies, etc.) shed their spring and fall coat of brown fur for white fur in the winter". This is not a form of evolution. For if this were an example of evolution it would also be an example of de-evolution, because the hare will once again have a brown coat in due season. Even at a molecular level where you would hope to find evidence of evolution there is none. The hare's body is reacting to a biological clock located in one of its many brain functions. The reaction is a defense mechanism that the hare has no control over and is imprinted in its DNA. In the DNA is a command to shed brown hairs for white and vise versa at the according time.

DNA (deoxyribo-nucleic-acid) is a blue print you can find in every living creature on the planet, even some viruses. DNA contains a code similar to the binary codes used to program a computer. The codes look something like this: 010111000110101000011110. A sequence of 1's and 0's give precise descriptions of commands the computer requires in operate program. If you add or subtract a 0 or a 1 from that sequence new computer functions or an entirely new program would run.

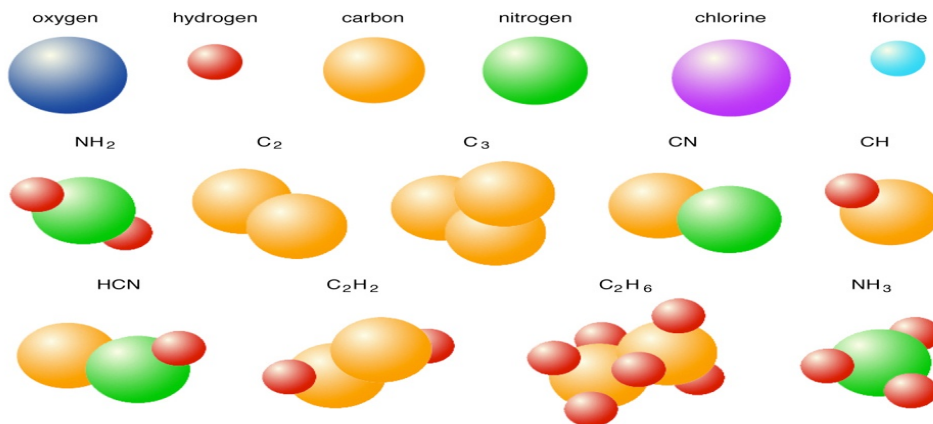

DNA has the same sequence system as binary code but instead of using numbers like 1 and 0 it uses genes. The genes carry a sequence similar to 00011010101010 (except with letters like ATCG) and in order to change how a person or animal will look, or act, or what it will eat, or its life expectancy (that's right that secret to never dying of old age is found in the genes) you would have to rearrange the "bio-nary code" found in the genes. Even though we can manipulate a creature by transferring genes from one creature to another we can not write or rewrite genetic code. It is highly impossible that by a one in a trillionth chance DNA with preinstalled genetic code accidentally formed and that all the beauty and intelligence found on this planet are just meaningless freaks of nature, or it is what it looks like; intelligent design. That's the same as saying a computer with programs preinstalled just appeared out of nowhere on your desk from some strange freak of nature. No of course not. Someone obviously built the computer and programmed it, and someone obviously put it on your desk.

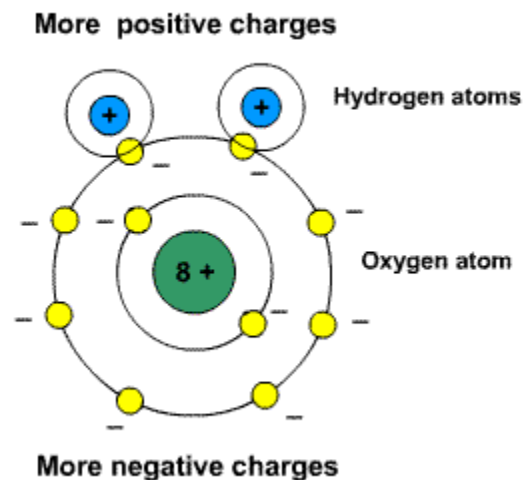

Humans and animals may sometimes carry genes that appear to be similar (like humans and apes) to one another. However these appear to just be finger prints of the great Atoner. Even if we could teach an animal to talk there are certain things it would never say or do, due to its genetic structure. If you taught an animal to talk it would never say, "I wonder who put us here; is there a God?" or "It is better to have loved and lost love, than to have never loved at all." They would not sit and write a novel or poetry explaining beauty and all its depth. Animals lack the brain capacity to understand intelligent design. They can learn however, basic commands. Animals that naturally love and take care of one another can be taught to love and take care of Humans. We can also change their appearance and attitude through unnatural selection (when we breed them). But if it's not already in there programming then there is nothing we can do to make them more Human. If you have a pet crock that you raised from birth and one day you fall in the water and need help, that crock is not about to save you.

In fact you better hope he just stays away from you altogether, because it is in his genetic code to pull you under the water and death roll. A death roll is an attack move programmed into crocks and alligators before they hatch so that they can hunt and survive. Even if he likes you his natural genetic code is very likely to come into play.

• Molecules

Molecules are the building blocks of existence. Everything in our universe from animate to inanimate objects, are made from molecules. A Molecule is made up of a nucleus and negatively and positively charged atoms (A.K.A. Adams). These atoms cause electrolysis when they rotate around the nucleus. This gives the molecule energy to move and vibrate. Everything in the universe produces some level of heat, even very low degrees of heat like the heat produced by ice. Most of this heat is a result of friction caused by molecules vibrating, rubbing, and bouncing off one another.

The Warmer an object is the faster and further apart the molecules move and bounce around. This causes less solidity in that object. The colder an object is the slower and closer molecules move causing that object to gain more solidity. For example: cold H_2O turns to a solid/ice, warm H_2O is liquid/water, and hot H_2O turns into a gas/steam.

Molecules are constantly moving; they never stop. If they stopped moving then whatever object they create would fall apart molecule by molecule, and since our entire universe depends on the movement of these molecules it is more than just chance or freak of nature that these super complex building blocks of existence were self formed and then self sustained. In fact, nothing is self sustained in our universe. You don't even sustain yourself. Molecules that you have no control over form your body, its organs and fluids. Genetic code imprinted into your cells programming tells the organs and fluids what to do. It tells your blood cells to deliver oxygen and food throughout the body and it also tells your brain, lungs, and heart to keep working subconsciously. The universe (and every person or thing in it) relies on the rotation of the negative and positive atoms in a molecule to get a charge. The real evidence of intelligent design is found here on a molecular level. Molecules are not perpetually motivated creations, and if they were they would still need something or someone to get the ball rolling according to the theory of Relativity.

Mass (speed of light X speed of light) = Energy. Basically this theory can be simplified by saying $E = m + p$. Mass + propulsion = Energy. A baseball on the ground does not have the energy to throw itself. Energy must first be transferred from your muscles to your arm then to the ball. Say if the ball lands in a garden and knocks over an object, that object is knocked over because some of the energy from the ball is transferred to the object (like dominoes). In other words all of the energy in the universe had to come from an energy source greater than itself (God).

I could keep going on and on about intelligent design and this should be more than enough evidence for any logical person to recognize intelligent design but still encourage you to do your own research.

Maybe by now you have come to the conclusion that there is a God, and you may be asking yourself, "If God is real, then who is God?" "How do I know who is telling the truth about God?" "Is there any proof that points to who God is?" During this second half we will be covering and answering these questions in a piece I call:

The History of God

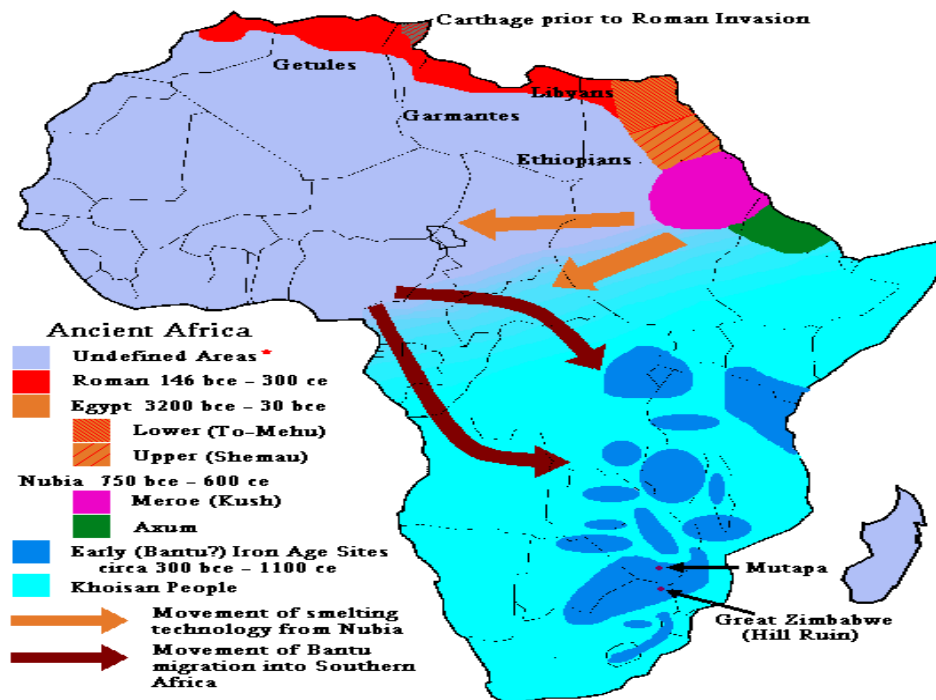

In this section I will explain why I believe what I believe. Hopefully I will inspire some of my readers to research the facts for themselves in the hopes that they too will find God.

It's okay to ask yourself, "Who is God?" I too asked myself that question before. Even though I was raised in the Christian belief, I found myself a bit confused and curious about other religions. I even started to lean toward evolution as a possible means that God used to create life on Earth. This led me to a study of other religions which led to a study of history. God is all throughout history, however history is basically his-story and stories can be changed. Well, stories told by man can be changing but the God I was looking for would not change. He would have no reason to change. A super being with the power and intelligence to create the universe would be incapable of making a mistake. In fact the very thought that this "Supreme Being" was imperfect and capable of making mistakes would mean that existence at anytime could fall apart. What if God made a mistake on the Sun, or the Earth, or the molecules that hold the universe together? No! This universe was created by an infallible all powerful (infinitely powered) super intelligence, and if this being left evidence that he tried to communicate with us or left any instructions for us, then what he left us would be timeless and unchanging.

I believed that the evidence of God's word did surface in the form of one of the major religions of the world. I believe that in some way we (mankind) imitate God much like how lower life forms (animals) imitate us. So I came to the conclusion that the beginning of mankind held the answer to who God is.

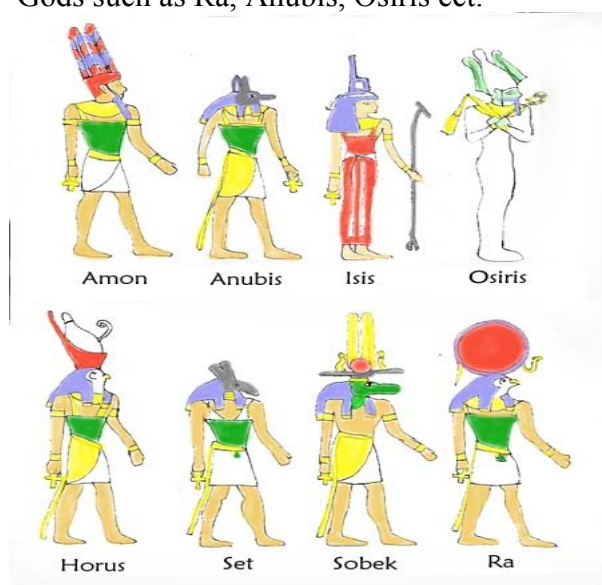

• The Beginning of Man & Religion

Historians, Geologists, and Archaeologists all link the beginning of mankind to Africa (makes a lot of sense seeing that once upon a time all land on the Earth was connected to form a single hunk of land with Africa as the heart). The oldest evidence of major civilizations is that of the Egyptians and Nubians (now known as Ethiopians).

I decided that the history of God would start in Africa, but this did not mean that I rejected the research of gods in other countries. This was just a method I was using to narrow (simplify) my research in order to find the bare facts. The beliefs of people around Egypt and Ethiopia (I would say the Nile River) consisted of three types: (monotheism) the belief in a single all powerful being (one god), (polytheism) the belief in many supernatural beings (many gods), and (universalism) the belief that we (mankind) and the universe and everything in it are gods connected by a cosmic energy.

Egyptians believed that many gods created and ruled the world. Gods such as Ra, Anubis, Osiris ect.

This belief traveled up toward Europe where places like Rome and Greece adopted polytheism. You can tell that the Greeks and Egyptians shared common beliefs by studying their religions. You can also come to the assumption that the Romans and Greeks adopted their beliefs from the Egyptians by geographical location as shown on the preceding map and because the Egyptian religion and culture rose to succession before the Romans and Greeks. If life started near the Nile River then that would mean that Romans and Greeks are a descendant of the Egyptians and Nubians (pretty much like everyone else in the world). The Egyptians believed that the gods sent their own to Earth as Man to govern the rest of mankind as Pharos. Was the Egyptian belief true? Well obviously not, because if it were true, there would have been more evidence than just Hieroglyphics, but lets not stop there. Polytheism (the belief in many gods) is resurfacing in a new form which suggests that all religions lead to the same God. This belief has a huge flaw. All religions and beliefs do not lead to the same God. These beliefs give very specific details on what or who they believe God is and how to reach His supreme awesomeness. Each religion contradict each other on how to reach God or who He is. For example: Buddhists believe that we are all gods who have not yet taken our place in the universe, but Christianity believes that no human is a God but Jesus, and that the only way to reach God is through the Son Jesus Christ. Buddhism and Christianity contradict one another and could not possibly lead to the same God. Sorry folks, I've digressed from the point so let me now reiterate my research on the Egyptians. Was the Egyptian pharaoh a god in the flesh? Even though Egypt was the most advanced civilization of its time there was little to believe that pharaoh was a god. A pharaoh was a ruler in Egypt that lived the lifespan of a normal human being and throughout his lifetime never performed a miracle. No miraculous acts were recorded by the Egyptians of there rulers. No pharaoh controlled the weather, raised the dead, or any other prophecy or miracle worthy of being considered a god. They made mistakes and were killed (like humans) but never came back to life. The Egyptian religion consisted of many myths and legends that had no proof of ever existing. Along with gods that never showed themselves to more than one witness. I believe that if God is real (and I'm pretty sure we covered this in the science of God as described in the first chapter) then this God would appear to more than just one witness at a time. At least appear to a whole village just once. After very decisive reasoning I made an educated choice to exclude the Egyptian belief from my quest for the identity of God. However as you read on you will discover the reimplementation of the Egyptians to my research.

The Naga people were a people who came from Ethiopia and believed in a form of "poly-universalism." They believed in negative and positive forces that come together to form the universe. This belief is called **Sanatana Dharma** (according to ancient Naga sanskrit).

**Kali****Krishna****Murugan****Serpent**

The Naga wore helmets that resembled serpents (there most valued deity). It is also strange that their deity Krishna (now known as the Sun) means Black (or so they say). The Naga (Ethiopians) conquered India somewhere between 1100 and 800 B.C. and brought with them the religion Sanatana Dharma and the written language Sanskrit. The people of that Indian region were later called Hindu. Sanatana Dharma acquired the name **Hinduism**, which was named after the people who practiced this religion and way of life. This religion was later studied by an Indian prince by the name of Gautama Siddharta. Gautama Siddharta claimed that he was the first human to reach a supreme oneness with the universe called Buddha.

The rest of this chapter is not available in the free version. To download the Full version of Master Science for \$0.99 (also available as paperback) go to <http://www.masterscience.webs.com>
